

FinAuth-Audit evaluates whether authorization benchmarks themselves are valid

Benchmark layers

Controlled core
Mechanistic generators
Provenance graphs
Public + order-book replay
Actual models + training

Execution rules

Direct and confidence
Cost and risk
Role and provenance
Lifecycle routing
Equal-info adapters

Routing

execute
reduce
human review
abstain

Validity audits

NUAR / ALR / coverage
Certification surface
Point-in-time power
Mechanism coverage
Freeze and field access

F1

Coverage-aware certification

frontier, not a
single winner

F2

Provenance under partial observability

Bayes-risk
information cost

F3

Source/mechanism transfer

200-date inverse
not supported

F4

Validity gates + hidden challenge

mixed FAIL and
N/A retained
